IN THE CLAIMS:

Please amend claims 1, 2, 4, 13, 13, 15 and 23-26 as follows.

1. (Currently Amended) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a sourcecustomer domian, a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from the customer domain.

2. (Currently Amended) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a sourcecustomer domain, a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, marking comprises determining if the sending rate estimate is less than a first rate threshold and in response to a determination that the sending rate estimate is less than the first rate threshold, setting a probability of marking at least one data packet with a first selected priority level is one of a plurality of priority levels, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from the customer domain.

3. (Previously Presented) The method of claim 2, further comprising

in response to a determination that the s is less than the first rate threshold, incrementing a burst size.

4. (Currently Amended) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a sourcecustomer domain, a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, marking comprises determining if the sending rate estimate is between a first rate threshold and a second rate threshold and in response to a determination that the sending rate estimate is between a first rate threshold and a second rate threshold, setting a probability of marking a data packet with a subordinate priority level based on s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from the customer domain.

5. (Previously Presented) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a source; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, marking comprises determining if the sending rate estimate is between a first rate threshold and a second rate threshold and in response to a determination that the sending rate estimate is between a first rate threshold and a second rate threshold, marking a data packet such that a rate of packets marked a subordinate policy level is no greater than 1 - first rate threshold/s.

6. (Previously Presented) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a source; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, marking comprises determining if the sending rate estimate is above a second rate threshold and in response to a determination that the sending rate estimate is above the second rate threshold, marking the packet such that a rate of packets marked the second priority level is at least (second rate threshold–first rate threshold)/s.

- 7. (Previously Presented) The method of claim 6, further comprising in response to a determination that the sending rate is above the second rate threshold, marking the packet such that a rate of packets marked a lowest priority level is at least (s- second rate threshold)/s.
- 8. (Previously Presented) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a source; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s;

determining if the sending rate estimate is greater than a rate threshold;

in response to a determination that the sending rate estimate is greater than the rate threshold, determining if a burst size is greater than a minimum burst; and

in response to a determination that the burst size is greater than the minimum burst, marking the packet a first priority level.

9. (Previously Presented) The method of claim 8, further comprising in response to a determination that the burst size is greater than the minimum burst, decrementing the burst size.

10. (Previously Presented) A method, comprising:

determining a sending rate estimate, s;

determining any credits or debits for a packet stream including a plurality of data packets from a source; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s;

determining if the sending rate estimate is greater than the super rate threshold, determining if a burst size is greater than a minimum burst; and

in response to a determination that the burst size is greater than a minimum burst, marking the packet a priority level based on a count of packets marked a highest priority level during a period.

11. (Previously Presented) The method of claim 10, further comprising in response to a determination that the burst size is greater than the minimum burst, decrementing the burst size.

12. (Currently Amended) An apparatus, comprising:

a first determining unit configured to determine a sending rate estimate, s; and

a second determining unit configured to determine any credits or debits for the packet stream, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

a marking unit configured to probabilistically mark the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from a customer domain.

13. (Currently Amended) An apparatus, comprising:

a first determining unit configured to determine a sending rate estimate, s; and

a second determining unit configured to determine any credits or debits for the packet stream, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

a marking unit configured to probabilistically mark the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet

marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from a customer domain, the marking unit comprising

a third determining unit configured to determine if the sending rate estimate is less than a first rate threshold; and

a setting unit configured to set a probability of marking at least one data packet with a first selected priority level to a first value, said means responsive to a determination that the sending rate estimate is less than the first rate threshold, wherein said first selected priority level is one of a plurality of priority levels.

14. (Previously Presented) The apparatus of claim 13, further comprising a unit configured to increment a burst size, in response to a determination that the s is less than the first rate threshold.

15. (Currently Amended) An apparatus, comprising:

a first determining unit configured to determine a sending rate estimate, s; and

a second determining unit configured to determine any credits or debits for the packet stream, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

a marking unit configured to probabilistically mark the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a

plurality of data packets from a customer domain, the marking unit comprising a third determining unit configured to determine if the sending rate estimate is between a first rate threshold and a second rate threshold; and

a setting unit configured to set a probability of marking a data packet with a subordinate priority level based on s, said-means-responsive to a determination that the sending rate estimate is between a first rate threshold and a second rate threshold.

16. (Previously Presented) The apparatus of claim 12, wherein the mark unit comprises a determining unit configured to determine if the sending rate estimate is between a first rate threshold and a second rate threshold and another marking unit configured to mark a data packet such that a rate of packets marked a subordinate priority level is no greater than 1 - (first rate threshold /s) in response to a determination that the sending rate estimate is between a first rate threshold and a second rate threshold.

17. (Previously Presented) An apparatus, comprising:

a first determining unit configured to determine a sending rate estimate, s; and

a second determining unit configured to determine any credits or debits for a packet stream including a plurality of data packets from a source, a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

a marking unit configured to probabilistically mark packet stream to one of a plurality of priority levels based on the sending rate estimate, s, the marking unit comprising a third determining unit configured to determine if the sending rate estimate is above a second rate threshold; and

a marking unit configured to mark the packet such that a rate of packets marked the second priority level is at least (second rate threshold - first rate threshold)/s, in response to a determination that the sending rate estimate is above the second rate threshold.

18. (Previously Presented) The apparatus of claim 17, further comprising another marking unit configured to mark the packet such that a rate of packets marked a lowest priority level is a least (s- second rate threshold)/s, in response to a determination that the sending rate is above the second rate threshold.

19. (Previously Presented) An apparatus, comprising:

a first determining unit configured to determine a sending rate estimate, s; and

a second determining unit configured to determine any credits or debits for a packet stream including a plurality of data packets from a source, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met;

a marking unit configured to probabilistically mark the packet stream to one of a plurality of priority levels based on the sending rate estimate, s,;

a third determining unit configured to determine if the sending rate estimate is greater than a rate threshold;

a fourth determining unit configured to determine if a burst size is greater than a minimum burst, in response to a determination that the sending rate estimate is greater than the rate threshold; and

another marking unit configured to mark the packet a first priority level, in response to a determination that the burst size is greater than a minimum burst.

20. (Previously Presented) The apparatus of claim 19, further comprising a decrementing unit configured to decrement the burst size, in response to a determination that the burst size is greater than the minimum burst.

21. (Previously Presented) An apparatus, comprising:

a first determining unit configured to determine a sending rate estimate, s; and

a second determining unit configured to determine any credits or debits for a packet stream including a plurality of data packets from a source, a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met;

a marking unit configured to probabilistically mark the packet stream to one of a plurality of priority levels based on the sending rate estimate, s;

a third determining unit configured to determine if the sending rate estimate is greater than a super rate threshold;

a fourth determining unit configured to determine if a burst size is greater than a minimum burst, in response to a determination that the sending rate estimate is greater than the super rate threshold; and

another marking unit configured to mark the packet a priority level based on a count of packets marked a highest priority level during a period, in response to a determination that the burst size is grater than a minimum burst.

22. (Previously Presented) The apparatus of claim 21, further comprising a decrementing unit configured to decrement the burst size, in response to a determination that the burst size is greater than the minimum burst.

23. (Currently Amended) A method, comprising:

determining a first probability by using a first algorithm;

determining at least one second probability by using a second algorithm, the first algorithm being different from the second algorithm; and

weighting each probability so that each probability contributes to a net probability, wherein the weighting comprises determining any credits or debits for a packet stream

including a plurality of data packets from a source, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from a customer domain.

24. (Currently Amended) A computer program embodied within a computer readable medium, when executed the computer program includes means for marking a packet stream including a plurality of data packets from a source by performing:

determining a sending rate estimate, s; and

determining any credits or debits for the packet stream, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from a customer domain.

25. (Currently Amended) A system for marking a packet stream including a plurality of data packets from a source, comprising:

a metering tool for determining a sending rate estimate, s; and

a determining means for determining any credits or debits for the packet stream, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

a router for probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from a customer domain.

26. (Currently Amended) An apparatus for marking a packet stream including a plurality of data packets from a source comprising:

a metering tool for determining a sending rate estimate, s; and

a determining component for determining any credits or debits for the packet stream, wherein a probability marking of the packet stream is improved while there is a sufficiently accumulated credit and when a first criterion is met; and

a marking component for probabilistically marking the packet stream to one of a plurality of priority levels based on the sending rate estimate, s, wherein the packet marking is on a flow-aggregate or aggregate basis for the packet stream including a plurality of data packets from a customer domain.
